

The "Easy" and "New Easy" Bolt Clippers.

BEST IN THE WORLD. OVER 37,000 SOLD TO JANUARY 1, 1896.

A Good Story. Read It!

Did you ever hear of the minister who swapped horses at a camp meeting with a deacon from another town, and found when he got the horse home that it was stone blind? This showed the superior business ability of the deacon, who afterwards, when accused of cheating by the minister, said to him, "Well, there, Elder; I told my wife there was something about that horse I forgot to tell you, and that's it, b'gosh!" It's a good story, and the moral of it is that things are not always what they seem. He was a bad deacon, with nothing moral about him.

The readers of THE BLACKSMITH AND WHEEL-WRIGHT know all about the construction of my tools.

They know they are the only ones having a locking device for the bolts through the straps and jaws.

In all others the jaws work on common bolts which will either work loose or else tighten up so that the tools cannot be used.

They know they are the only ones having elastic buffers between the handles, and they know the value of these.

They think they know all about the adjustment, but do they know that my tools are the only Open Shear Clippers made, having sufficient adjustment to take up the wear of the cutting edges during years of use?

All other clippers of this kind get the whole or a part of their adjustment, by different devices for varying the opening between the handles.

This plan was tried and given up more than twenty-five years ago; it gives very little adjustment, as when the handles of such clippers are nearly closed the motion of the jaws is very slight.

The adjustment of the jaws, and the amount that can be worn off the cutting edges, is five times as much in the "Easy" and "New Easy" Clippers, as in any other open shear clipper made, and considering that when the adjustment of a clipper is used up, it is necessary to get a new pair of jaws, it will be seen how little the saving of a few cents in buying such a clipper really amounts to.

The great success of the "Easy" and "New Easy" Clippers has led to many others being put on the market, but so far no other good adjustment has ever been discovered.

The "Easy" Clipper is adjusted by shims and the "New Easy" by steel set screws. It is a great improvement, and the No. 1 and No. 2 "New Easy" will be got out as soon as possible.

The No. 0 "New Easy," called "The Baby," is a perfect tool. It is small, light, strong and cheap, and has a lot of adjustment. It is the greatest tool for tire bolts and rivets ever made, and is selling like hot cakes.

When buying tools always buy the best; they are always the cheapest in the end.

These tools are made of the best stock and in the most careful manner, and they are
